

### Problem And Motivation

The problem of using Jupyter notebook is that users have the ability to present algorithms along with the corresponding code segments, but no visualization. Our project aims to add animated graph visualization to the execution of finite state machines, derivation of sentences and algorithm of Earley's parser animation.

### Earley's Parse Animation

```
g3 = ("S->E", "E->a")
x3 = "a"
a3 = Animate(g3,x3,auto_generate=True)
a3.display()
next
```

**Predict**  
s[0]: E → •a, 0

**Match**  
s[1]: E → (a)•, 0

**Complete**  
s[1]: S → (E(a))•, 0

===FINISH===

### Sentence Derivation Animation

```
grammar0 = nltk.CFG.fromstring("""
S -> 'a' S | 'b' | """)
parser0 = nltk.ChartParser(grammar3)
sentence0 = ['a', 'b']
t0 = list(parser0.parse(sentence0))[0]
print(t0)
pt0 = PTGraph(t0)
pt0.display()
```

### Finite State Machine Animation

```
#user define states
states = ['0', '1', 'f']
#user define final states
finals = ['f']
#user define transitions
transitions = [
    { 'trigger': 'a', 'source': '0', 'dest': '1' },
    { 'trigger': 'b', 'source': '1', 'dest': 'f' },]
#Check if the FSM accept string 'abc'
check_str = 'ab'
g = FSMGraph(states, finals, transitions, check_str)
g.display()
```

### Test And Result

- Unit testing and black-box testing
- Conducted test case for animation by passing in parameters and check the output. The function will output visualization for accepted parameter, and output "Error input" for unaccepted parameter.

```
grammar1 = nltk.CFG.fromstring("""
S -> NP VP
PP -> P NP
NP -> N | Det N
VP -> V NP | VP PP | AVP NP
AVP -> AV V
AV -> 'will'
Det -> 'the'
N -> 'fine' | 'end' | 'Everything'
V -> 'be'
P -> 'in'
""")
parser1 = nltk.ChartParser(grammar1)
```

### Error Test

sentencel = [will', 'be', 'fine']

File "<ipython-input-11-413809792563>", line 15  
sentencel = [will', 'be', 'fine']  
^

SyntaxError: invalid syntax

### Conclusion

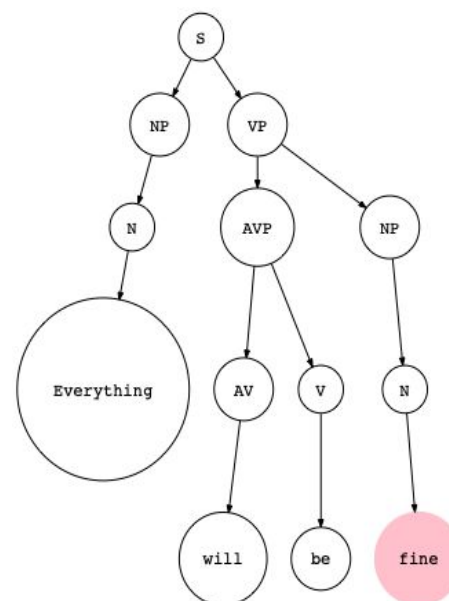

This project is useful for the generation of theoretical algorithm and visualization the step by step execution process.

### Success Test

sentence2 = ['Everything', 'will',  
'be', 'fine', 'in', 'the', 'end']

### Statistics

- 660 lines of code
- 15 success test case, 3 error test case, 1 unit test
